Cotton Varieties Planted, United States
1964-1968

Estimates of the percentages of the various varieties of cotton planted in the United States in 1968, by counties, Smith-Doxey cotton classing office territories and states are presented in this report. Comparative variety data for the four years 1964-1967 are shown by states. A preliminary report containing percentage distributions of cotton varieties planted by counties and cotton classing office territories in the early harvesting sections of south Texas was published in mid-June.

The variety data presented herein are based primarily on estimates furnished by cotton ginners for the territories served by their gins. Supplemental information is obtained by others closely related with cotton farming in their respective areas, such as seed breeders, seed dealers, farmers and county agents. These estimates should serve as reliable guides as to the geographic distribution of various varieties grown throughout the Cotton Belt.

Over 60 percent of the cotton acreage planted in the United States is planted to three leading varieties - Stoneville, Acala and Deltapine. A percentage distribution of the six leading general varieties planted in 1968, with comparisons for the four preceding years, is shown at the foot of this page. All strains of each particular variety are combined for the purpose of this comparison.

Stoneville continues as the leading variety of cotton planted in the United States by a slight margin, representing slightly over 21 percent of the total 1968 acreage. This compares with 20 percent in the two preceding years. Stoneville is the principal variety grown in Arkansas, Mississippi, Missouri and Louisiana. Stoneville 213, the predominating Stoneville strain, accounts for 15 percent of the total acreage planted this year.

Acala is the second leading variety of cotton planted this season. Estimates indicate that this variety accounts for nearly 21 percent of total acreage, as compared with 17 percent a year earlier. The increase in acreage planted to Acala is mainly a result of the continued gain in popularity of the Acala 1517 strains, which now comprise about seven percent of the total United States acreage. Acala is the principal variety planted in California, New Mexico and southwest Texas (Carlsbad and El Paso classing office territories).

Deltapine is the third leading variety of cotton planted this year with 19 percent of the total acreage against 17 percent last year. The two most popular Deltapine strains, DPL Smooth Leaf and DPL 16, represent ten and eight percent, respectively, of the total United States cotton acreage this season.

Lankart continues to hold its place as the fourth leading variety. The proportion of the total acreage planted to this variety, however, dropped considerably this year and accounted for nine percent of the total compared with 14 percent a year earlier. Lankart 57, the major Lankart strain represents seven percent of the total 1968 planted acreage.

Coker continues to grow in importance and this year accounts for eight percent of total cotton acreage against five percent a year earlier. The sixth leading variety this year is Paymaster with seven percent of the total acreage compared with five percent a year ago. Increased acreage planted to these two varieties is due primarily to the rising popularity of the Coker 413 and Paymaster 111 strains.

The leading Pima strain of American-Egyptian cotton planted in 1968 is Pima S-4. This relatively new strain replaces Pima S-2, the former leader. Pima S-4 accounts for most of the acreage planted to American-Egyptian cotton in Arizona and California. Pima S-3 gained in popularity in New Mexico this year but the leader in that state as well as in Texas remains Pima S-2.

Estimated percentage of cotton acreage planted to specified varieties, United States, 1964-1968

Year	Acala	Coker	Delta-pine	Lankart	Paymaster	Stoneville	Other 1/	Total

1/ Compiled from "Summary of Cotton Fiber and Spinning Test Results, Crop of 1967", USDA, C&MS, Cotton Division, April 1968.

2/ Micronaire reading is a measure of fiber fineness and maturity. This test measures resistance of a plug of cotton to air flow.

3/ Fiber strength indicates ability of cotton fibers to withstand force or tension, and has a strong bearing on spinning utility. "0" gage fiber strength test made without a spacer between clamp jaws using Pressley flat bundle tester. 1/8" gage strength test made with 1/8" spacer between clamp jaws using Stelometer and results are adjusted to the Pressley level.

4/ Digital Fibrograph 2.5% span length indicates length spanned by 2.5 percent of the fibers when they are parallel and randomly distributed. This measure is closely related to staple length designations. Digital Fibrograph 50/2.5 uniformity ratio values indicate relative uniformity of fiber length in samples.
